5 Rujukan (EN dan lain-lain):

Barangan sesuai dengan Heading 84.43 dan mendapat liputan di muka surat XVI-8443-1 hingga 3 seperti berikut:

This heading covers (1) all machines.....(2) other printers, copying machines and facsimilies machines, wheather or not combined.

(II) OTHER PRINTERS, COPYING MACHINES AND FACSIMILE MACHINES, WHETHER OR NOT COMBINED.

(A)Printers.

(B)Copying machines

This group includes apparatus for the production of copies from original documents, such as:

(1)Digital copiers in which the original document is scanned and a photosensitive surface (e.g., a charge-coupled device (CCD) or photo diode sensing array) converts the optical image.....

(2)Photocopiers in which the optical image of the original document must be projected onto the photosensitive surface for each copy. The most common types are:

(a) Electrostatic photocopying apparatus which operated either by reproducing the original imagedirectly onto the copy (direct process) or by reproducing the original image via an intermediate onto the copy (direct process).

In the direct process the optical image is projected onto a substrate, (usually of paper) coated with, for example zinc oxide or anthracene, charged with static electricity. After the latent image has been developed by means of a powdered dye, it is fixed to the substrate by heat treatment.

In the indirect process, the optical image is projected onto a drum (or plate) coated with selenium or other semiconducting substance charged with static electricity. After the latent image has been developed by means of a powdered dye, it is transferred onto ordinary paper by applying an electrostatic field and fixed to the paper by heat treatment.

(b) Apparatus using chemical emulsion coatings in which the photosensitive surface consists of an emulsion usually containing silver salts or diazo compounds. The developing and printing process vary according to the nature of the emulsion and the type of apparatus.

(C)Combinations of printers, copying machines or facsimile machines.

Machines which perform two or more of the functions of printing, copying or facsimile transmission are generally referred to as multi functional machines. This machine are capable of connecting to an automatic data processing machine or to a network.
