*This heading covers a group of self-propelled vehicles of the types used in factories, warehouses, dock areas or airports for the short distance transport of various loads (goods or containers) or, on railway station platforms, to haul small trailers.*

*Such vehicles are of many types and sizes. They may be driven either by an electric motor with current supplied by accumulators or by an internal combustion piston engine or other engine.*

*The main features common to the vehicles of this heading which generally distinguish them from the vehicles of heading 87.01, 87.03 or 87.04 may be summarised as follows:*

- (1) Their construction and, as a rule, their special design features, make them unsuitable for the transport of passengers or for the transport of goods by road or other public ways.**
- (2) Their top speed when laden is generally not more than 30 to 35 km/h.**
- (3) Their turning radius is approximately equal to the length of the vehicle itself.**

*Vehicles of this heading do not usually have a closed driving cab, the accommodation for the driver often being no more than a platform on which he stands to steer the vehicle. Certain types may be equipped with a protective frame, metal screen, etc., over the driver's seat.*
